Purpose of the Dataset

The 2015 Local Governance Performance Index (LGPI) survey aimed to evaluate governance and service delivery at the local level in Tunisia. It specifically targeted Tunisian citizens aged 18 or older to assess their experiences, perceptions, and satisfaction with local governance and service provision. This survey contributes to understanding governance dimensions, including authority, service delivery, and local development, among others. Conducted in May 2015, this initiative was part of the Program on Governance and Local Development at Yale University, funded by the Moulay Hicham Foundation and Yale University, reflecting a concerted effort to analyze and improve local governance structures and outcomes in Tunisia.

Scope of Data

After the interviewer training program, the face-to-face multi-topic survey was administered in the field in May 2015 to a nationally representative sample. A multi-stage sampling design was used to first select six governorates (Wilayat) by probability of selection proportional to size (PPS). Within governorates, the “delegation” that is the seat of the governorate was selected as a self-representing unit, while two other delegations were selected at random, also by PPS. We thus obtained a set of 18 municipalities/delegations as secondary sampling units (SSUs). Given the lack of updated census information below the SSU level, the selection of TSUs (defined as square half-arc minutes from a spatial grid) was conducted by gridding each municipality with the lasted nightlight-data from the DMSP-OLS series. The light intensity of each pixel on the remote-sensing image was used as proxy for the relative population density within the municipality. Ten TSUs (and a backup unit) were drawn within each SSU. Finally, the enumerators were sent to 20 randomly selected coordinates within each TSU. Taking those as starting points and using instructions to conduct a random walk, enumerators reached and contacted the corresponding households. Within each household, computer tablets were used to select a final respondent through a “Kish grid” in order to select eligible individuals randomly within households. Interviewers of either gender proceeded to interview

the randomly selected respondent, whether male or female and then administered the entire questionnaire using the tablet. This process resulted in 3557 completed interviews.

Response Rate

Response Rate : 59.3%

Overview of Sampling

The survey was fielded February-March 2015 in 6 of Tunisia's 24 governorates (Bizerte, Monastir, Mahdia, Sfax, Siliana, and Tunis), focusing on 3 municipalities in each governorate. A multi-stage sampling design was used to first select six

governorates (Wilayat) by probability of selection proportional to size (PPS). Within governorates, the “delegation” that is the seat of the governorate was selected as a self-representing unit, while two other delegations were selected at random, also by PPS. We thus obtained a set of 18 municipalities/delegations as secondary sampling units (SSUs). Given the lack of updated census information below the SSU level, the selection of TSUs (defined as square half-arc minutes from a spatial grid) was conducted by gridding each municipality with the lasted nightlight-data from the DMSP-OLS series (see Fig.1)

The light intensity of each pixel on the remote-sensing image was used as proxy for the relative population density within the municipality. Ten TSUs (and a backup unit) were drawn within each SSU. Enumerators were sent to 20 randomly selected coordinates within each TSU. Taking those as starting points and using instructions to conduct a random walk, enumerators reached and contacted the corresponding households. Within each household, computer tablets were used to select a final respondent through a “Kish grid” to select eligible individuals randomly within households. Interviewers of either gender proceeded to interview the randomly selected respondent, whether male or female and then administered the entire questionnaire using the tablet.

Acknowledgements

We are grateful for the financial and logistical support of the Moulay Hicham Foundation, Yale University, the World Bank, and the Swedish National Research Council.

Consent

This is a public opinion survey. Participants names and opinions will be kept confidential. We are conducting a study to understand the types and methods of governance in your area. We value your views in order to improve your quality of life. Your name will not be listed in the survey, and your participation is confidential. If you want, I will give you a sheet of paper to write your details, and we can contact you to attend a presentation of the results. We are very grateful for your cooperation. Do not feel compelled to answer any question you aren't comfortable answering, and don't hesitate to ask for clarification if you feel a question is a little difficult or unclear. Do you agree to participate?

Dataset Variable Naming Convention

The dataset variables are categorized into various topics, with each topic identified by a four-letter code prefix, followed by a matching question number from the survey instrument.

For example:

- Age is a demographic variable and follows the prefix *demo*, with the corresponding reference *q_100* in the survey instrument.
- The variable is therefore named **demo_q100** in the dataset.
- The exact wording of *q_100* can be referenced from the questionnaire provided along with the codebook.

This structured approach allows researchers to easily identify and select relevant variables that meet their research needs.

Notes:

- For detailed information on the survey questions, including the full text and answer options, as well as to understand the survey logic, rules applied and sequences of questions presented in a loop, please consult the survey questionnaire provided with this codebook.
- Reports and publication coming out of this survey can be found at <https://gld.gu.se/en/research/governance-and-service-delivery-in-post-revolutionary-tunisia-lgpi-tunisia-2015>
